Providing high-visibility delivery bags to food delivery riders

Food delivery riders provide many goods and services to the community, but can face safety risks when working on our roads. One way to reduce risk to riders is to ensure they are highly visible to other road users. Providing high-visibility delivery bags for your riders will help other road users see them while they are riding.

Produce and provide food delivery bags that:

- Are made entirely of bright fluorescent or retroreflective material. The best colours to use are yellow, orange or light green.
- Have retroreflective logos/markings and/or bands on the front, sides and straps if the bag is not entirely made of bright fluorescent or retroreflective material.
- Are able to be securely strapped to the bicycle or to the rider.
- Have additional clips to securely attach a light for added visibility at night.

Retroreflective logos, markings and bands:

- Logos and markings should be made entirely of retroreflective material and a bright fluorescent colour, such as white, yellow or silver. They should be large enough to be visible to other road users from a distance.
- Bands should be:
  - Made from compliant retroreflective materials and/or is specified to meet the AS/NZS 1906.4:2010 High visibility materials for safety garments standard
  - At least 40mm wide and long enough to cover the complete width of the bag
  - Placed on all outward facing sides of the bag including the shoulder straps
- Each outward-facing side of the bag should have at least two retroreflective bands.
- Figure 1 and Figure 2 show the best placement for retroreflective bands.
